Engineered Plastics Guide

■Line-ups and Characteristics of Engineered Plastics

		o una c	- I	-	ISUCS O	-115				ust		
Page	Material	Color Sample	Grade	Color	Generic Name	Electric Properties	Prop Continuous Use		_		Features	
			Standard	Blue	MC901	Insulation	-40°C 120°C	Δ	0	0	[Features]MC Nylon® of Nippon Polypenco Ltd. is the most general material in engineered plastics and used for various industrial purposes. Excels in mechanical strength and abrasion resistance, but not in dimension stability due to high water absorption.	
			Standard	lvory	MC900NC	Insulation	-40°C 120°C	Δ	0	0	[Appearance]Stripes on upper and lower surfaces of materials are developed from production process. Colors may have lot variations but it does not affect the physical properties. [Machinability]Machinability is good but harder to machine than that of Polyacetal due to special stickiness.	
			Sliding	Purple	MC703HL	Insulation	-40°C 120°C	Δ	0	0	[Features]Dynamic Friction Coefficient is low. Excels in sliding properties, abrasion resistance and mechanical strength. [Appearance]Strips on upper and lower surfaces of materials are developed from production process. Feel rough due to the special additive. [Machinability]Same as Standard Type. [Caulion]Do not use for processing of food oils and fats.	
P993	MC Nylon®		High Strength	Dark Brown	MC602ST	Insulation	Normal Temperature 150°C	Δ	0	0	[Features]Upper temperature limit is higher than that of Standard Type and excels in mechanical strength. [Appearance]Stripes on upper and lower surfaces of materials are developed from production process. [Machinability]Same as Standard Type. Material is harder than that of Standard Type.	
1.555	INIO NYION		Weather Resistance	Dark Gray	MC801	Insulation	Normal Temperature 120°C	Δ	0	0	[Features]Excels in weather resistance and abrasion resistance. Can be used outdoors over a long period of time. [Appearance]Stripes on upper and lower surfaces of materials are developed from production process. [Machinability]Same as Standard Type.	
		20	Conductivity CDR2	Black	MC501CDR2	Conductive	Normal Temperature 120°C	Δ	Δ	0	[Features]Conductivity CDR2: Has the highest conductivity in the MC Nylon® conductive grades. Suitable where quick conductivity is required. Conductivity CDR6: Electrical property is between conductive and antistatic. The most general and economical	
			Conductivity CDR6	Black	MC501CDR6	Antistatic	Normal Temperature 120°C	Δ	Δ	0	in the MC Nylon® conductive grades. Conductivity CDI9: Electric property is antistatic. Has the highest heat resistance in MC Nylon® of conductive grade. [Appearance]Marks are printed with "R2" (white), "R6" (yellow) and "R9" (green) markers on upper and lower surfaces of the material to distinguish the conductive grades. Stripes on upper and lower surfaces of materials are	
			Conductivity CDR9	Black	MC501CDR9	Antistatic	Normal Temperature 150°C	Δ	0	0	developed from production process. [Machinability]Same as Standard Type. Material contains carbons and is harder than that of Standard Type. [Caution]Do not use as heating elements or electric parts such as contact points or terminals.	
			Standard	White	POM Duracon	Insulation	-45°C 25°C	0	Δ	0	[Features]General Engineered Plastics for various industrial purposes. Equal to Duracon®. Has low water absorption and excels in dimension stability, Inferior to MC Nylon® in heat resistance and abrasion resistance. [Appearance]Upper and lower surfaces look and feel smooth. Weld line (resin flow mark) is developed from production	
P.997	Polyacetal		Standard	Black	POM Duracon	Insulation	-45°C 95°C	0	Δ	0	process. [Machinability]Good machinability.	
			Antistatic	Ocher	-	Antistatic	Normal Temperature 80°C	Δ	0	0	[Features]No-carbon antistatic material is used and effective for antistatic. [Appearance]Unlike Standard Type, weld line (resin flow mark) is not highly visible. [Machinability]Same as Standard Type.	
			Paper Bakelite	Natural Color	Laminated phenol formaldehyde resin w/paper base	Insulation	-50°C 100°C	0	× .	× ~	[Features]General material for various purposes such as insulation and heat resistance. Paper-based materials are more inexpensive than cloth-based materials. [Appearance Dipper and lower surfaces are glossy and smooth. Natural color tone vary per production lot. Color becomes	
P.1001	Bakelite		Paper Bakelite	Black	Laminated phenol formaldehyde resin w/paper base	Insulation	-50°C 100°C	0	× .	× ∴	darker due to oxidation over time. However, it does not affect properties. Paper-based black color does not change. [Machinability]Good machinability but dust scatters when machined.	
			Cloth Bakelite	Natural Color	Laminated phenol formaldehyde resin w/cloth base	Insulation	-50°C 100°C	0	× .	× ~	[Features]General material for various purposes such as insulation and heat resistance. Cloth-based materials have higher strength than paper-based materials. [Appearance Upper and lower surfaces are smooth and have grains. [Machinality]Good machinability but dust scatters when machined. Cloth-based materials have less machinability than paper-based materials due to lamination.	
P.1007	Ероху		Standard	Green	Glass Epoxy	Insulation	Normal Temperature 155°C	0~0	× .	× ~	[Features]Excels in heat resistance, heat insulation and electrical insulation. [Appearance]Upper and lower surfaces are glossy and smooth. Cut surfaces appear whitish. [Machinability]Because made of laminated glass fiber and epoxy resin, drilling or cutting in the direction of lamination may cause cracks.	
r. 100/	Glass		High Temperature	Black	-	Antistatic	Normal Temperature 260°C	o~	× .	× ~	[Features]Excels in heat resistance, heat insulation and antistatic effect. [Appearance]Unlike Standard Type, upper and lower surfaces are not glossy but smooth. [Machinability]Same as Standard Type.	
P.1009	Ultra High- Molecular-		Standard	Milky White	UHPE UHMWPE New Lite®	Insulation	-100°C 80°C	Δ	0	0	[Features]Standard:Has low specific gravity and is lightweight. Excels in abrasion resistance and sliding properties. New Lite® of Saxin Corporation is used for the standard type of ultra-high-molecular-weight polyethylene. Electrical ConductivityExcels in sliding property and abrasion resistance at ambient temperature with low load. Also excels in conductivity.	
r. 1009	weight Polyethylene		Electrical Conductivity	Black	-	Conductive	-100°C 80°C	Δ	0	0	Appearance Clear white for Standard Type. Pullout marks are left at the extruded direction. Surfaces feel smooth. Machinability Hard to machine as they are soft. Be careful of the way to fix. Caution Storing them against the wall causes warpage. Be sure to lay them out flat. Do not use Conductive Type a heating elements or electric parts such as contact points or terminals.	
P.1011	Fluorine		Standard	White	Teflon PTFE	Insulation	-40°C 250°C	× △	0	0	[Features]Excels in heat resistance and chemical resistance. Fluororesin is Polytetrafluoroethylene resin (equal to Teffon®). [Appearance]Upper and lower surfaces look and feel very smooth. [Machinability]Mard to machine as they are soft and become swollen. [Caution]Storing them against the wall causes warpage. Be sure to lay them out flat.
